Computer Time Sales

COMPUTER TIME SALES

Boeing Computer Services offers computer time on a variety of equipment, large and small. Conventional terminal services, remote job entry, data acquisition, and conventional batch service — all are available through our nationwide telecommunication system. The simple combination of a terminal and a telephone gives you instant access to the BCS telecommunication network.

Whether you are considering computer support for the first time, planning to augment your present system, or simply looking for better terminal service, BCS can satisfy your requirements. Terminal services are provided in two economical and easily implemented forms: CTS (conversational terminal services) and RJE (remote job entry). Together, they give you broad-spectrum computer capability without major investment.

CTS

CTS is an interactive service, providing immediate answers to inputs from remote terminals. At BCS this response is furthered by a new element of reliability — the backup capability of duplex IBM 360/67's. CTS can be used as a separate system or to augment an existing system. If you are using your own equipment on major programs, CTS provides parallel capability to simultaneously develop new programs.

Features of CTS are:

- Powerful editor and command languages
- A range of processors (Fortran, Cobol, Basic, PL/1, Assembly)
- Application programs, including COGO (coordinate geometry) and ECAP (electronic circuit analysis program)
- Use of high-speed peripheral equipment

RJE

RJE is ideal for running batch programs from remote locations. With it, the power of a large computer center is available to you through any of various types of terminals and small computers. In addition to terminal input, card printer input and output can be used. Using BCS's powerful control language, output can be directed to the originating terminal or to other terminals. Output can also be stored (under strict security) at a BCS data center.

Data Base Services

DATA BASE SERVICES

Boeing Computer Services has developed many large data base systems. Typical of these is a parts inventory control system that maintains part locations and ensures that proper quantity levels are maintained. The system provides general reporting capabilities, and data can be accessed by the user on request.

BCS data base technology covers a variety of services:

- General consultation, including analysis of your specific problems and needs
- System design, using simulation as needed to verify performance
- Implementation of customer data base applications
- Installation of application programs on BCS or customer computers
